

Christian Health Asset Mapping Consortium

Christian organizations provide a substantial share of health services in health facilities, community-based programs, and churches. They reflect the health ministry of the global church. As such, they are valuable partners and essential elements of local and international health strategies. There is a pressing need for more information about Christian health services' scope, location, and nature, and ways to efficiently contact local and global Christian health organizations for partnerships.

Unfortunately, a lack of data about these facilities, community programs, training institutions and drug distribution networks leads to undercounting of Christian health assets and exclusion from planning, partnerships, and research.

Christian Health Assets Landscape

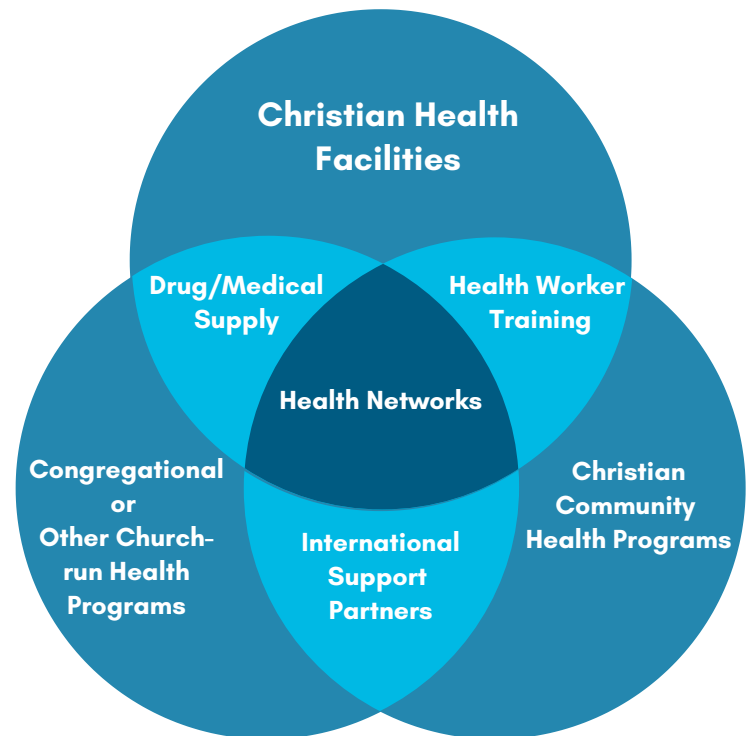

A comprehensive data and mapping strategy is needed to accurately reflect the breadth and complexity of Christian health assets. These assets include organizations that directly serve populations as well as those organizations that train or support direct service providers. The following graphic demonstrates visually the Christian Health Assets Landscape.

Direct service organizations include:

- Christian Health Care Facilities
- Christian Community Health Initiatives
- Congregational or Other Church-run Health Programs

Support organizations include:

- Networks of facilities and programs, such as the Christian Health Associations
- Drug and Medical Supply Organizations
- Health Worker Training Institutions
- International Support

The opportunity now is to improve access to timely and accurate information about Christian health assets in low- and middle-income countries (LMIC). We can generate learning (both peer-to-peer sharing and expert-led training). We can improve the quality of data and reporting about Christian health services in national and global data. As we succeed, this data can fuel advocacy, research and learning, and innovative partnerships.

Data and mapping on Christian health assets will be useful to the following audiences: policymakers who seek to plan for health systems; donors who seek to support Christian health services; church structures that need to understand their own role in health services; partners who seek to understand collaboration opportunities; and researchers who wish to study and evaluate health services and innovations.

The Christian Health Asset Mapping Consortium is a voluntary association of organizations that will work to address urgent needs for information on—and help improve quality of data about—the Christian health asset landscape.

Purpose

Vision: Stakeholders to Christian health assets will have better information about Christian health asset data and the nature of those services, especially in low- and middle-income countries.

Mission: This Consortium will increase resources, learning, and partnerships in Christian health services by improving understanding of the nature, scope, and location of those services.

Values: The core values of the Consortium are transparency, data awareness, data quality, partnership, and inclusive data governance.

Objectives

1. Create a **metadata** platform or “database of databases” that can be used by organizations and individuals to learn about registered data sets, including:
 - o Level of data/types of entities in a database
 - o Ownership/source of registered data
 - o Frequency owner maintains/updates data
 - o Datasets accessible to public
 - o Identifying contact or personal information
2. Support and inform stakeholders, policy, and other audiences by sharing information about Christian health services, including:
 - o Access to the “database of databases”
 - o Access to summary reports on data provided by members
 - o Referrals to specific data owners
 - o Monitor evolution of technology, standard datasets (e.g., DHIS2), and/or data streams from ministries of health, WHO, and others
3. Assess resources available to strengthen data on Christian health assets and develop plans to improve how members can access those resources.

Goals

- Highlight information on Christian health services and programs
- Identify and maintain information about Christian health asset data
- Share information about health asset data that benefits Christian organizations
- Improve representation of Christian health assets in national/global data
- Raise support or technical assistance to Christian organizations to improve data
- Create a learning community to improve data access and utilization
- Foster partnerships that analyze data and apply it for program development

Founding Members

- Africa Christian Health Associations Platform
- Catholic Health Association (US) International Outreach
- Christian Connections for International Health (CCIH)
- International Christian Medical and Dental Association
- The Dalton Foundation
- World Council of Churches

CCIH is also serving as the secretariat for the Consortium.

Products

The Consortium prioritizes sharing updated summary data to improve the scope and quality of data on faith-based health systems flowing into global databases. The Consortium produced a data brief in April 2022 of 16 Africa Christian Health Association Platform (ACHAP) members which includes more than 8,000 Christian health assets in 15 countries: <https://tinyurl.com/2022ACHAPdatabrief>.

Get Connected!

Engaging with the Consortium is a great way to stay informed about the Christian health landscape and develop partnerships. Here are some ways to get involved:

- **Want more information?** Check out more information at <https://www.ccih.org/christian-health-asset-mapping-consortium/>
- **Have resources to share?** Join our Listserv by searching Mapping-Consortium@googlegroups.com in Google and select “Ask to Join Group”
- **Have data to share?** Fill out this simple summary data tracker so we can follow-up about registering your dataset: <https://tinyurl.com/CHAMCdatatracker>
- **Still have questions?** Send us an email at mapping.consortium@ccih.org
