

What is Ebola?

Ebola is a virus that can only be seen in the blood with a machine.

Sudden fever Weakness Body aches Sore throat Stomach ache Vomiting Diarrhea

Ebola is spread by direct contact with fluids from the sick person's body. It takes 2 to 21 days for a person to show symptoms after contact with the Ebola virus.

Preventing Ebola

Go to the hospital immediately.

Wear gloves when caring for a sick person.

Clean up after a sick person using a half cup of bleach in water.

Don't share plates, spoons or cups with a sick person.

Don't touch the body of an Ebola victim without protective clothing.

Don't eat bats or dead bush animals.

Don't have sex for 7 weeks after you have had Ebola.
